Topic Date 2.7.24	Characterization of the planetary boundary layer above the Arctic sea ice by using the water vapor profiles from lidar measurements
Supervisors	Albert Ansmann (albert@tropos.de),
Further contact persons	Dietrich Althausen (dietrich@tropos.de), Julian Hofer (hofer@tropos.de), Ronny Engelmann (ronny@tropos.de)
Second reviewer	Matthias Tesche (matthias.tesche@uni-leipzig.de)
Brief description:	During the MOSAiC campaign, profiles of the water vapor mixing ratio north of 85°N were measured continuously with a lidar from October 2019 to February 2020. This water vapor information will be used together with results from radiosonde measurements to examine the structure of the Arctic planetary boundary layer and the coupling or decoupling of air masses to the sea ice and to investigate the water vapor budget of the Arctic boundary layer above the sea ice. The master's thesis bases on the master's thesis completed in 2023 (Seidel, 2022) with a focus on the evaluation of the water vapor measurements.
