Topic	Trade-wind cumulus in a warming climate
Release Date	15 July 2024
Supervisor (contact)	Matthias Tesche Institut für Meteorologie, Universität Leipzig Stephanstrasse 3, 04103 Leipzig Tel.: 0341/97-36660 matthias.tesche@uni-leipzig.de
Additional Contact	Torsten Seelig, torsten.seelig@uni-leipzig.de
Second Reviewer	Johannes Quaas, j.quaas@uni-leipzig.de
Description:	<p>Shallow trade-wind cumulus clouds occur over the warm subtropical Atlantic and the Caribbean under large-scale subsidence. They are affected by processes on different scales that govern their abundance and size. Their average cloud cover varies between 5% and 30% (Mieslinger et al., 2019) and their cooling radiative effect is estimated as -4.6 W m^{-2} (Hirsch et al., 2015). Shallow trade-wind cumulus cloud cover and the resulting radiative effect in a warming climate is mostly unquantified and forms the focus of this work.</p> <p>The CLAAS-2 (Benas et al., 2017) data set will be used to characterize trade-wind cumulus clouds over the subtropical ocean (Seelig et al., 2021). The data set starts in 2004 so that cloud properties can be studied on a climate-relevant time scale. The interpretation of cloud observations will be supported by the use of ERA5 reanalysis data.</p>
